

Yellow Clematis

Clematis tangutica (Aka Golden Clematis, Golden Tiara, Virgins-Bower, Radar Love, Helios)

Alec McClay

Alec McClay

Overview:

Yellow clematis is a perennial vine of the buttercup family, native to high mountain areas of China and India. It reproduces both by seed and vegetatively from stem pieces. Vines grow rapidly either along the ground or will climb and cover other shrubs/trees, fences and trellises. It is widely available as both an ornamental plant and seed under a variety of names - Golden Clematis, Golden Tiara, Virgins-Bower - from seed; Radar Love, Helios. *C. tibetana* is a very similar yellow flowered clematis that is also available and hybridizes with *C. tangutica*.

Yellow clematis has become very common and becoming abundant at some sites in the Bow Valley corridor from Wheatland County through Calgary to Canmore; also in city of Medicine Hat, town of Jasper, city of Edmonton, MD of Pincher Creek².

In Alberta there is a native blue-flowered clematis which grows in the foothills – *C. occidentalis* or common names Blue clematis, blue Virgin's Bower³. A white-flowered clematis native to western N. America is *C. li-*

gusticifolia var. *ligusticifolia* – Western white clematis or white Virgin's Bower.

Habitat:

Yellow clematis is tolerant of cold, drought, nutrient-poor soils, and part shade, but prefers full sun. It develops a long taproot³ can be found thriving in open woodland, grassy areas and even gravelly areas such as railway ballast and industrial areas. In its native habitat it grows at elevations of 1300-5400 m⁴.

Identification:

Stems: Several stems per plant, growing up to 3-4 m long¹. Young stems are green while the older stems are tough & woody.

Leaves: Are bright green and compound with 5-7 lance-shaped leaflets 5-6 cm long, which may be lobed. Leaf tips are pointed and leaf edges are coarsely toothed. Leaves may be slightly hairy on the underside and are deciduous.

Flowers: Are lemon-yellow, nodding, with

four petals, and appear mid-summer through late fall. Flowers are bell-shaped at first and then flatten as the petals spread. Petals may be silky-hairy on the outside and occasionally tinged purplish-brown¹. Flowers are borne at the ends of stems or in leaf axils – usually solitary but sometimes 2 or 3 together - on a short (0.5-3 cm) peduncle¹ (flower stem). Bracts are similar to the leaves but smaller⁴. Seeds are oval (3.5-4.5 mm long) with silky tails about 5-6 cm long⁴.

Prevention:

Yellow clematis is distributed mainly through the nursery trade, and then spreads far beyond the gardens and flowerbeds via its abundant, wind dispersed seed. Do not purchase plants or seeds labeled with any of the names listed above.

Control:

Grazing: Not known. Invasive plants should never be considered as forage.

Cultivation: Not known. Unlikely since stem pieces can produce new plants and

vines climb and out-shade any competing vegetation.

Mechanical: Repeated hand pulling prior to seed set can provide effective control and possibly eradicate small infestations³.

Chemical: Currently no herbicides are registered for use on yellow clematis. Always check product labels to ensure the herbicide is registered for use on the target plant in Canada by the Pest Management Regulatory Agency. Always read and follow label directions. Consult your local Agricultural Fieldman or Certified Pesticide Dispenser for more information.

Biological: None researched to date.
